How do we want to measure the top-quark mass?

- use same approach as in l+jets channel for 8 TeV:
- measurement is based on a **3D-Template method:**
- Variable 1: $m_{\mathrm{top}}^{\mathrm{reco}}$ from reconstructed event
- Variable 2: $m_{\mathrm{W}}^{\mathrm{reco}}$ from chosen jet permutation, sensitive to JSF
- Variable 3: $R_{bq}^{\mathrm{reco},1b} = \frac{p_{\mathrm{T}}^{b_{\mathrm{tag}}}}{(p_{\mathrm{T}}^{W_{\mathrm{jet}_1}} + p_{\mathrm{T}}^{W_{\mathrm{jet}_2}})/2}$, $R_{bq}^{\mathrm{reco},2b} = \frac{p_{\mathrm{T}}^{b_{\mathrm{had}}} + p_{\mathrm{T}}^{b_{\mathrm{lep}}}}{p_{\mathrm{T}}^{W_{\mathrm{jet}_1}} + p_{\mathrm{T}}^{W_{\mathrm{jet}_2}}}$.

  from chosen jet permutation, sensitive to bJSF

- need full reconstruction of $t\bar{t}$ final state
- template parametrisation of the 3 variables
- unbinned likelihood fit is performed

Plan for 13TeV analysis:

First test: run same workflow as for 8 TeV
